H <sub>2</sub> O	0.0013
Iainnya	0.0213

Apa itu  
**BLACK POWDER?**

.....

# BLACK POWDER

*Granular contaminant in natural gas pipeline*

Black powder yang ditemukan pada 32" Barrel of Pig Receiver pada 28" Transmission Gas Pipelines Gresik - Semarang pada kegiatan *pigging*

## Black Powder

Kontaminan halus dan korosif dalam pipa gas alam, terdiri dari oksida, sulfida besi, dan pengotor lainnya yang dapat menyebabkan gangguan aliran gas dan kerusakan peralatan instalasi migas

# Potensi Sumber Black Powder

- 1 Mill scale dari proses manufaktur pipa
- 2 Reaksi korosi lingkungan selama penyimpanan pipa
- 3 Proses *pre-commissioning & commissioning* (dewatering process, dsb)
- 4 Senyawa korosif dalam gas (e.g. H<sub>2</sub>O, H<sub>2</sub>S, CO<sub>2</sub>) dan kondisi operasi yang menyebabkan korosi internal
- 5 Carryover dari fasilitas produksi gas di sisi hulu

## Dampak

- Penurunan *Flow Rate* Penyaluran Gas
- Komplain Konsumen Gas
- Erosi & Integrity Pipa
- Tingginya Biaya O&M

# BLACK POWDER

*Granular contaminant in natural gas pipeline*

## Proses Pembentukan

### Reaksi Korosi

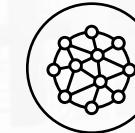

Terjadi di ruas pipa penyalur

Dipicu oleh adanya *moisture*, CO<sub>2</sub>, H<sub>2</sub>S dan komponen korosif lainnya

### Oksidasi & Reaksi Kimia

Terjadi reaksi kimia antara pipa dengan komponen korosif (zat asam)

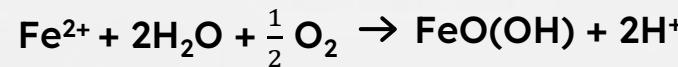

### Akumulasi Partikel

Membentuk deposit black powder dalam pipa

**Magnetite**  
Oxygen-limited oxidation

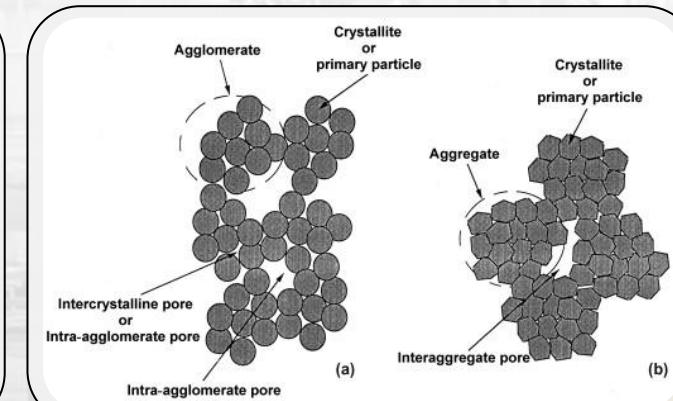

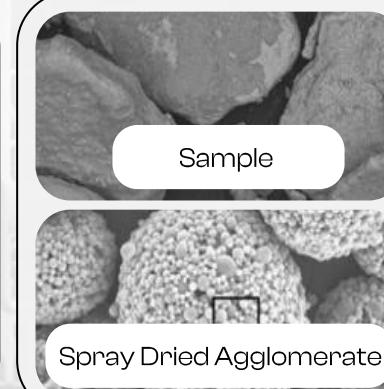

**Goethite**  
Partial oxidation with moisture

**Iron Carbonate**  
Absorption of CO<sub>2</sub> in water

### Methods help remove black powder from gas pipelines

Nikolaos A. Tsochatzidis  
DEPA SA  
Sofia, Bulgaria

Konstantinos E. Maroulis  
DEPA SA  
Athens

Based on presentation to Pipeline Rehabilitation & Maintenance Conference, Istanbul, Sept. 14-17, 2006.

Included in this examination are

the presence of black powder

DEPA's high-pressure gas network

Effective removal of black powder from a gas transmission system often requires a combination of methods. Removing such particulates is a multistep process requiring a comprehensive understanding of the nature of the problem. Different tools may be effective in some instances but not in others.

This article examines Greek Public Gas Corp. SA's (DEPA's) experience in fighting black powder in its system, focused on determining which technique provided the most efficient and cost-effective method of powder removal.

Included in this examination are the different sorts of pigs, filters, and separators DEPA used in attempting to address the problem, with the effectiveness and shortcomings of each assessed.

**Background**

Black powder is a solid contaminant found in natural gas transmission and distribution systems throughout the world. Chemical or biological reactions with steel found in natural gas pipelines, gas wells, and associated facilities can create black powder. Solids may be simple or complex mixtures of small particles dispersed in gas (particulates) or they may be dispersed in water or liquid hydrocarbons (slurry).

Formation cuttings, drilling mud, desiccant dust, construction dirt, sand, mill scale, iron oxide, iron carbonate, iron sulphide, welding slag and splatter, eroded steel cuttings, salt crystals, valve gaskets, steel shavings, and other organic materials, as well as debris, contribute to the presence of black powder.

DEPA's high-pressure gas network (Fig. 1) first experienced operational problems caused by black powder in imported natural gas in March 1999.

DEPA performed a pigging operation on the first 12 km of the Greek pipeline from the Bulgarian-Greek border at Promachonas to the border metering station, removing 1,000 kg of powder.

Over time, black powder contamination of DEPA's network increased gradually as gas officines increased. Increased powder gathering in the gas pipelines

# What's on DEPA?

"Greek Public Gas Corp SA's (DEPA's) experience in fighting black powder in its system"

1

Jumlah black powder yang tertangkap dari kegiatan pigging : >11,620 kg

2

Treatment fokus pada *physical removal*, tanpa ada *chemical treatment*

3

Dampak yang dialami :

- *Clogged & collapsed filters*
- Penurunan efisiensi aliran
- *Deposits on gas measurement devices*
- *Penurunan Fungsional dan realibilitas peralatan*

4

Komponen major : Magnetite ( $Fe_3O_4$ ) and Quartz ( $SiO_2$ )

Komponen minor : Goethite ( $FeO(OH)$ ), Bementite, Manganese Oxide, dll

5

Pengendalian Black Powder :

- Penggantian filter berkala
- Instal cyclone filter
- *Series of Pigging* (inc. BiDi, Magnetic pig, Brush Pig)
- Analisa Sample di Laboratorium

# Strategi Utama DEPA: *Filtration*

*"The particles are able to shear easily at submicron sizes and pass through gas separation devices and filter capable of trapping particles as small as submicron"*

## Vertical Catridge Filter with Vessels

- Lokasi : Border Metering Entrance Station Upstream Pipeline
- Fungsi : Menghilangkan condensate, air, *scale*, dan material asing lainnya
- Material filter : fiber glass dengan phenolic resin dan silicon
- Batas dP Filter : >2 bar (29 psi)
- Efisiensi Separasi : 100% untuk partikel >3mikron, dan 99% partikel 0.5 – 3 mikron
- Frekuensi Penggantian Filter : ~3x / minggu

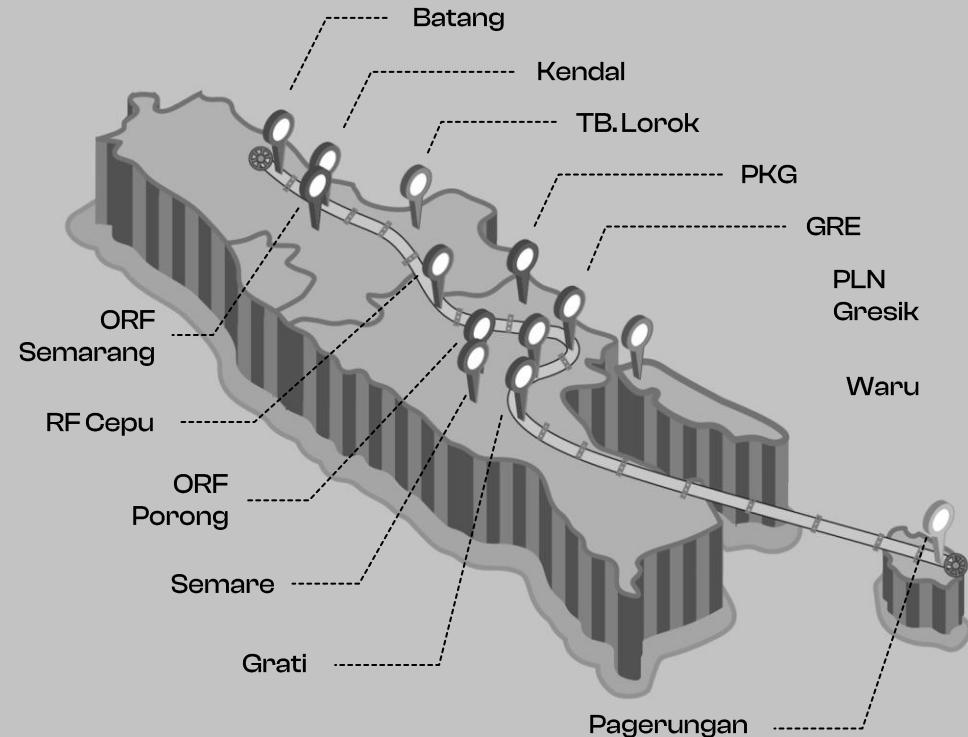

## Cyclone (Centrifugal) Separators

- Lokasi : Downstream pipeline
- Fungsi : remove debris, separasi compressor oil dan air dari aliran gas
- Batas operasi : ~1,000 kg
- Efisiensi Separasi : 99% partikel > 5 mikron

# THICKNESS MEASUREMENT

28" Gresik - Semarang Pipeline

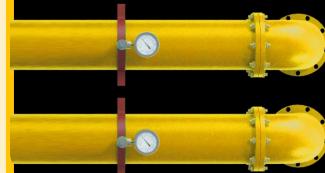

PRESENTED AT:

## TML Testing

- Thickness Measurement Location  
Riser pipe on LBCV, Straight Pipe, and Elbow
- Periodically – 6 Month

## Conclusion

- No significant Thickness reduction detected (avg < 3%)
- Further testing method required!
- Not conclusively attribute thinning erosion

## Thickness Reduction Points

Initial thickness: **11.91 mm**

### ➤ Rank #1

Thickness Reduction  
**3.21%** ~ 0.38 mm

Final thickness  
**11.53 mm**

### ➤ Rank #2

Thickness Reduction  
**2.20%** ~ 0.26 mm

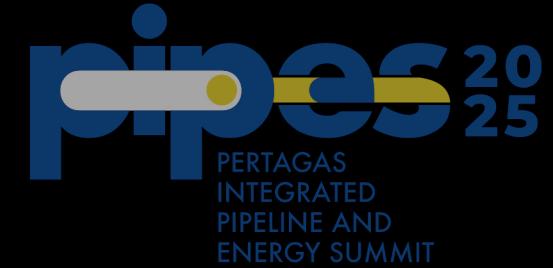

Final thickness  
**11.65 mm**

### ➤ Rank #3

Thickness Reduction  
**1.36%** ~ 0.16 mm

Final thickness  
**11.75 mm**

# TESTING METHOD [1]

Identifikasi karakterisasi black powder

## XRD (X-Ray Diffractometer)

Advanced Material Characterization

- Magnetite  
Oxygen-limited oxidation
$$3\text{Fe(s)} + 2\text{O}_2 \rightarrow \text{Fe}_3\text{O}_4\text{(s)}$$

- Goethite  
Partial oxidation with moisture

- Iron Carbonate  
Absorption of CO<sub>2</sub> in water

### Senyawa Dominan

- Calcium Sulfat
$$\text{Ca}^{2+} + \text{SO}_4^{2-} \rightarrow \text{CaSO}_4$$

- Iron Sulfide
$$\text{H}_2\text{O}_{(\text{condensed water})} + \text{H}_2\text{S} \rightarrow \text{H}_3\text{O}^+ + \text{H}^-$$

$$\text{HS}^- + \text{Fe}_{(\text{steel pipe})} \rightarrow \text{FeS} + \text{H}_2$$

- Senyawa lainnya yang mengandung Al, Mg, Na, K, Si, Ba

### Elemen Lainnya

# TESTING METHOD

Potensi terbentuk dari mill scale

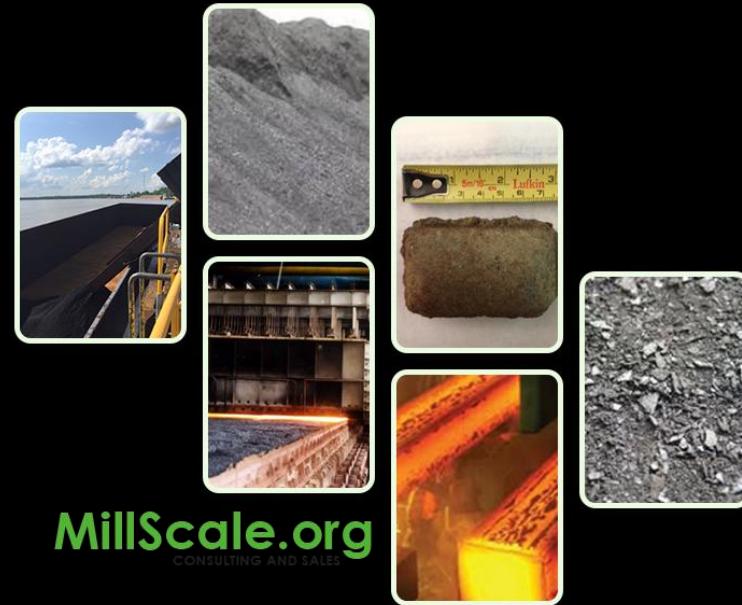

Metode verifikasi atas pembuktian asal black powder dari mill scale

Mill scale biasanya terbentuk pada proses oksidasi besi pada temperature tinggi, terjadi diatas 570 °C

Identifikasi keberadaan elemen senyawa FeO (wüstite) tidak ditemukan

Proses mill scale tidak berperan dalam pembentukan black powder

➤ Wuestite

**MillScale.org**  
CONSULTING AND SALES

# TESTING METHOD

Potensi Berasal dari sumber lain

Metode verifikasi atas pembuktian asal black powder dari sumber lain

Identifikasi keberadaan elemen senyawa calcium sulphate ( $\text{CaSO}_4$ ), senyawa sulfur dan elemen mineral lainnya yang tidak biasa ditemukan pada mills manufaktur pipa

Potensi black powder berasal dari sumber lain

► Calsium Sulfate

► Iron Sulfide

# TESTING METHOD

Potensi dari kondisi parameter operasional

Metode verifikasi atas pembuktian black powder dari kondisi operasi pipa Gresik - Semarang

Identifikasi keberadaan elemen senyawa  $\text{Fe}_3\text{O}_4$ ,  $\text{FeO(OH)}$ , dan  $\text{FeCO}_3$  yang terdeposit pada pipa

Tidak ditemukan kandungan air yang signifikan pada aliran gas

Nilai komposisi gas masih berada pada ambang batas mengacu pada access arrangement (AA)

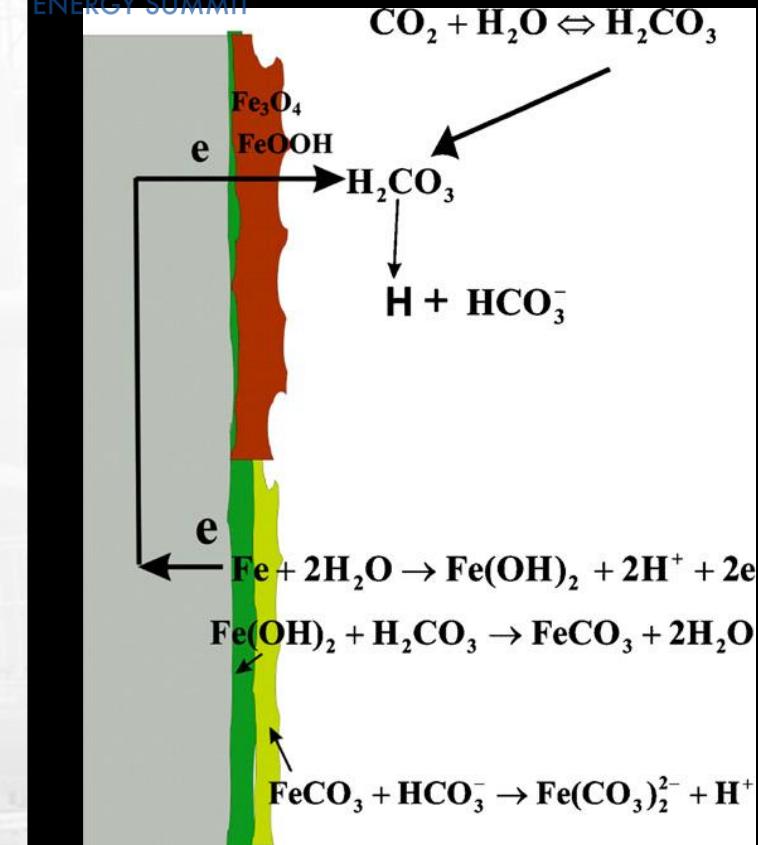

► Iron Carbonate

► Magnetite

► Goethite

# TESTING METHOD

Determine if Black Powder Comes From Internal Corrosion

## Atmospheric Testing

Degradation of metals cause by exposure air

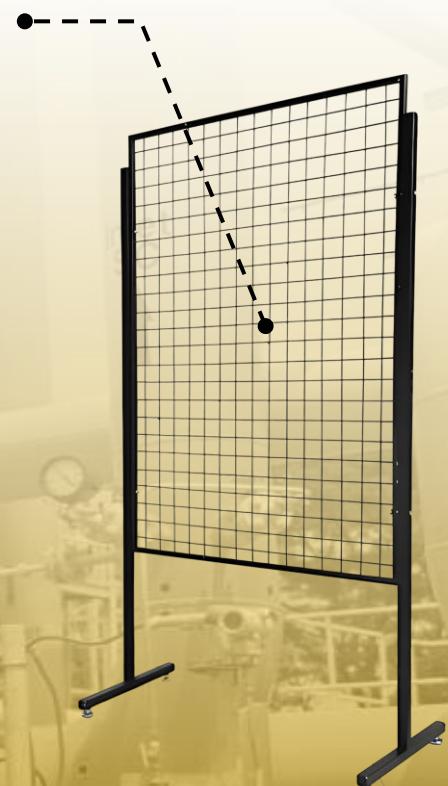

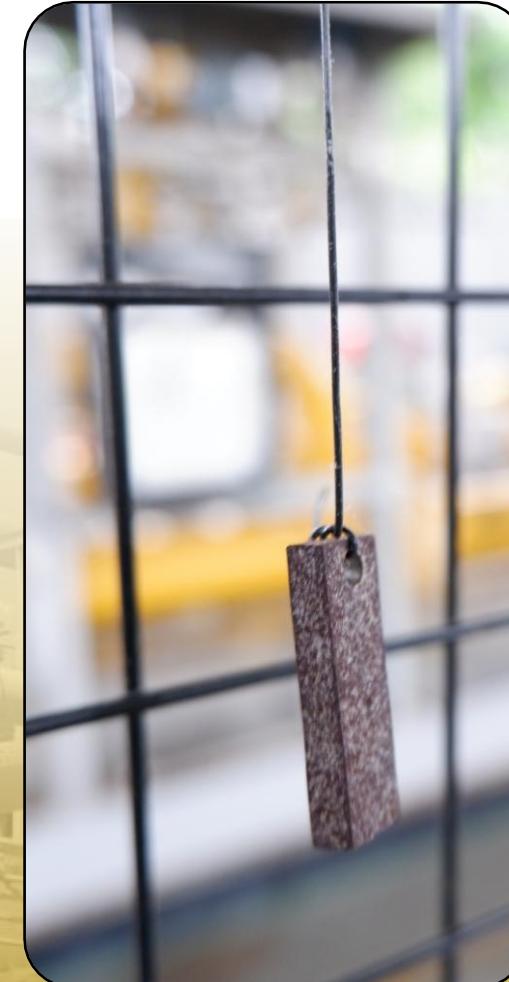

### Key Factors

- 🎯 Pollutants (SO<sub>2</sub>, H<sub>2</sub>S, NO<sub>x</sub>, chlorides)
- 🎯 Temperature
- 🎯 Humidity
- 🎯 Weather factors

### Step

- 1 Identify corrosion product composition
- 2 Compares results with black powder in pipelines
- 3 Determines if both have identical composition

Sample: Uses the same material affected by black powder

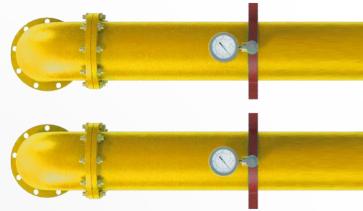

# TESTING METHOD

Determine if Black Powder Comes From Internal Corrosion

## HPHT Autoclaves

With Rotating Cage

Verifies if black powder originates from internal corrosion

Identifies corrosion products under controlled conditions

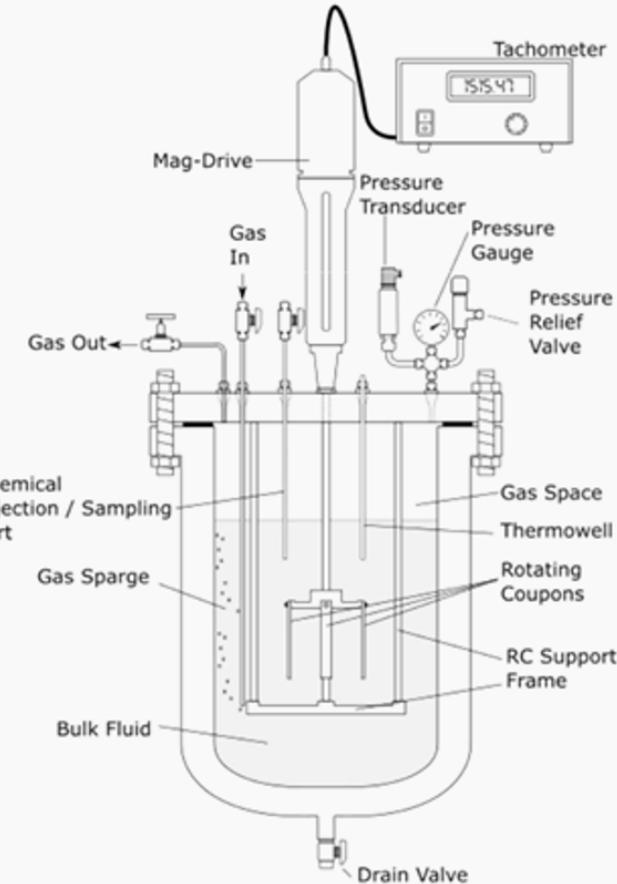

Simulates corrosive environments under **High temperature and pressure**

Evaluates the influence on corrosion

- CO<sub>2</sub>
- H<sub>2</sub>O
- H<sub>2</sub>S

Provide insights the effect of

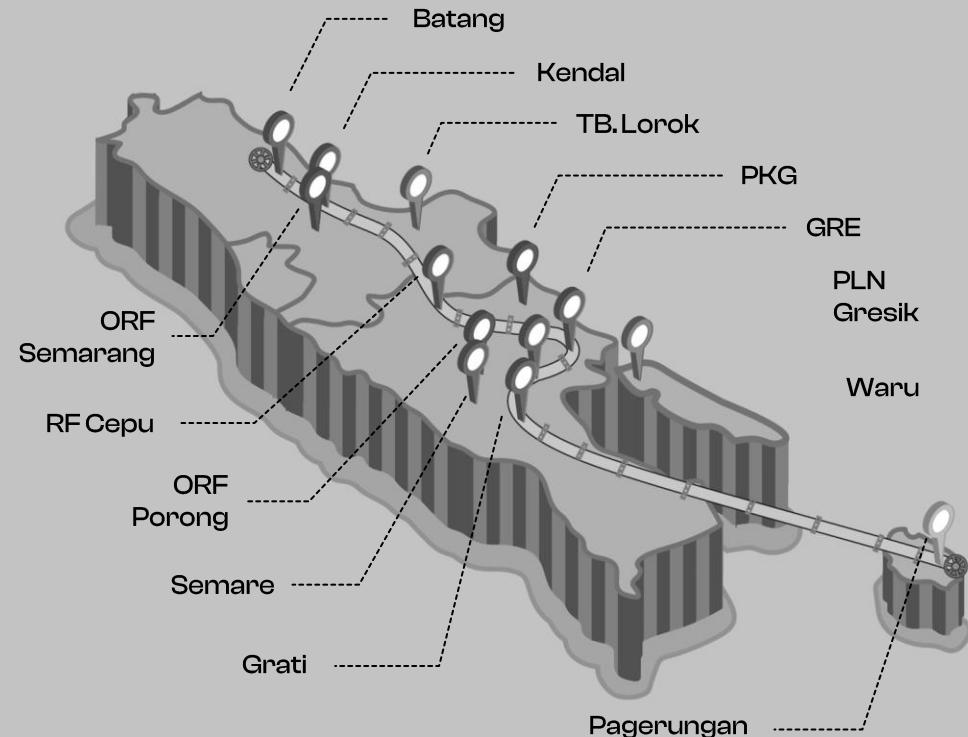

- Gas flow rate
- Pressure on metal degradation

# Strategi dan Rekomendasi

PT Pertamina Gas – Operation East Java Area

# COMBINATION METHOD

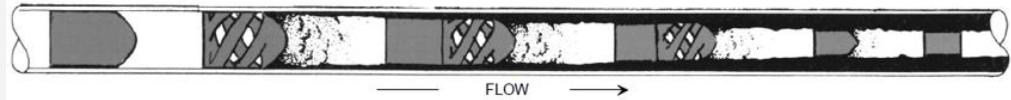

## Progressive Pigging

### Progressive Pigging

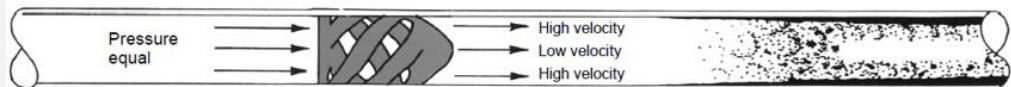

🎯 A staged cleaning process using foam pigs, cup pigs, and BiDi pigs with accessories.

🎯 Effectively reduces black powder accumulation and minimizes pigging failure risks.

This diagram shows schematically how the progressive pigging technique works by shaving off successive layers of encrustation gradually, so avoiding a "plugged" line.

This illustrates the forces at work enabling the POLLY PIG to clean efficiently and keep debris ahead in a state of suspension.

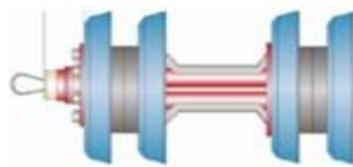

### Pig Type Selection

1

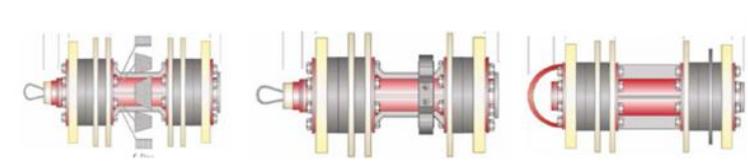

#### Foam Pig

Initial stage, low risk of getting stuck

#### Cup Pig

More effective cleaning, wear buttons prevent failure

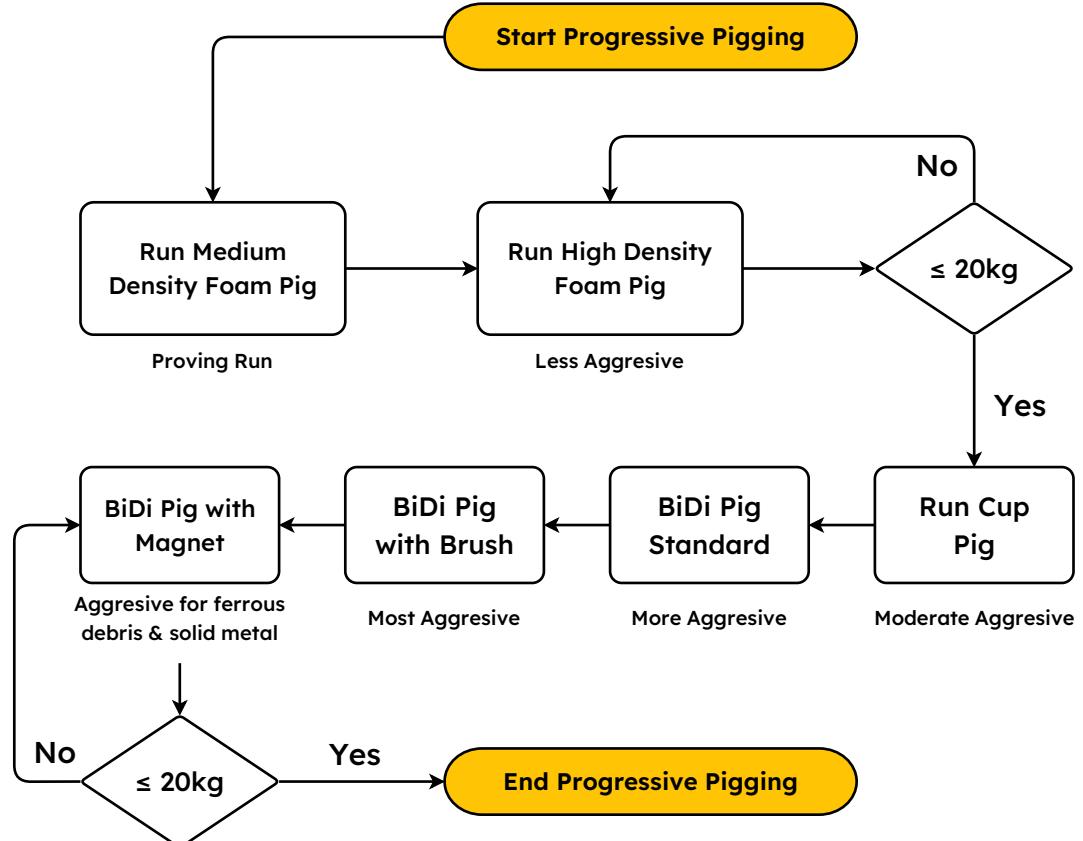

#### BiDi Pig

Final stage, equipped with brushes & magnets for deep cleaning

# COMBINATION METHOD

## Progressive Pigging

# COMBINATION METHOD

# In-Line-Inspection & Gas Monitoring

PRESENTED AT

## **2 MFL In-Line Inspection (ILI)**

- Uses Magnetic Flux Leakage to detect pipeline defects and assess corrosion

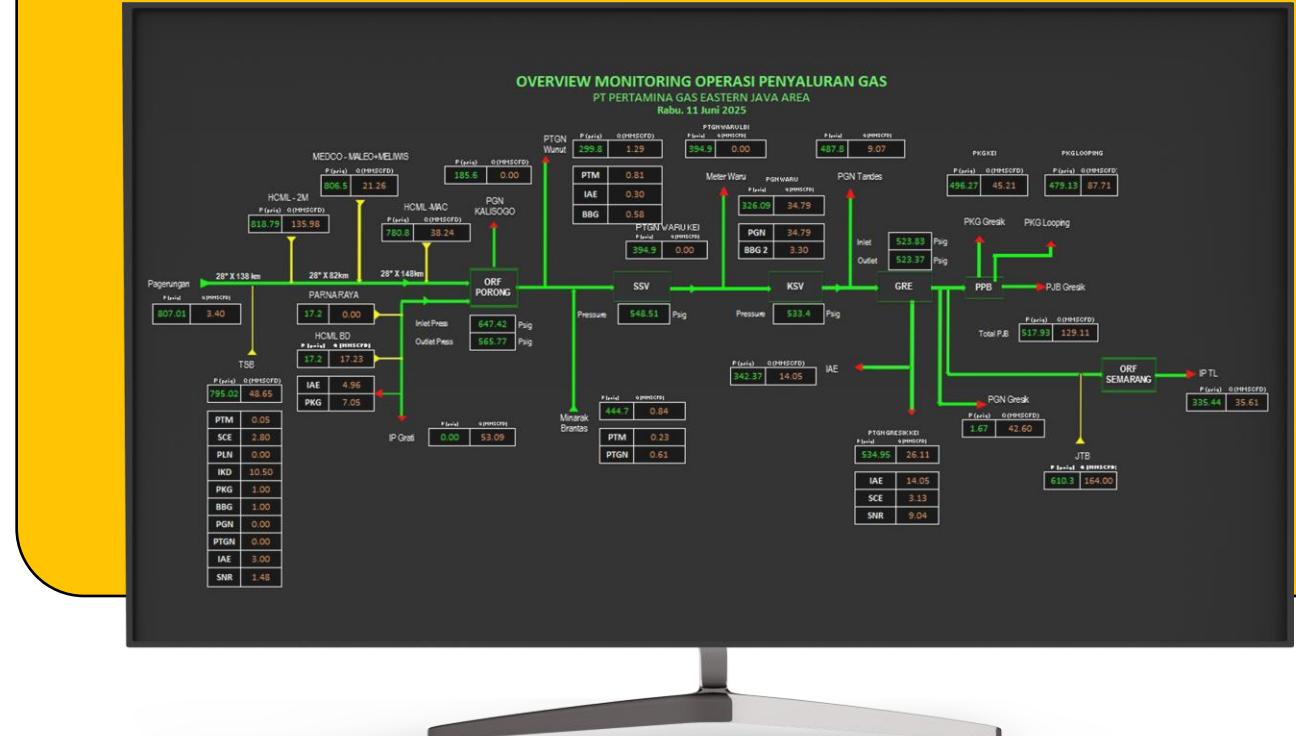

3

# Gas Monitoring

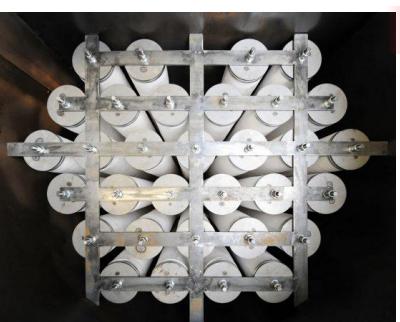

# Monitoring of Operation Parameter

pressure, temperature, flow rate, gas composition

# COMBINATION METHOD

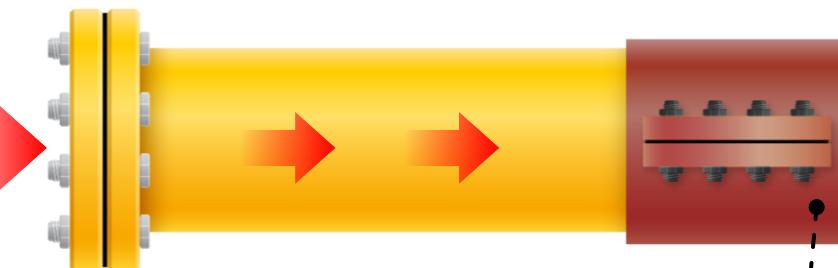

## Methods for Controlling Black Powder

- 4

### Gas Filters

Cyclone, dry gas, or magnetic filters remove solid contaminants for cleaner gas flow

- 6

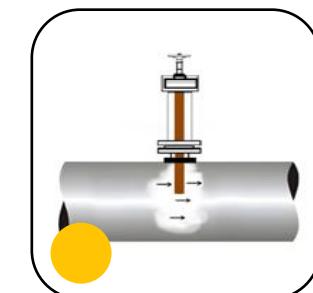

### Pipe Reinforcement

Strengthens pipelines with sleeves or clamps to restore integrity and prevent leaks

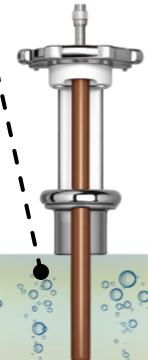

- 5

### Corrosion Inhibitors

Chemicals form a protective layer to prevent internal corrosion

- 

# TERIMA KASIH

*“Kemajuan tidak diukur dari seberapa cepat kita berlari, tapi dari arah yang benar kita tuju”*

**Abdurrahman Wahid (Gus Dur)**
